SCR-DI External Power Adapter

Question: The manual says that the external power adapter is 100mA, but the silkscreen on the pedal says 500mA. What do I need?

Answer: The pedal requires a 'minimum' of 100mA which is why it's listed in the power requirements section of the user manual that way. However, the optional 'safety approved' power supply we are able to provide is spec'd at 500mA, either of which is fine but will not matter being above 100mA. This is also why the screen art appears with 500mA to match up with the optional power supplies should they be purchased in the future. For those with One-Spot adaptors or generic or Boss brand DC9V power supplies already on-hand, so long as they are above 100mA (One-Spot adaptors are usually rated around 1500mA) with center pin negative, they will work fine.
